

Name: Vincent Bryan Bose	Date Performed: 09 - 11 - 2024
Course/Section: CPE31S2	Date Submitted: 09 - 11 - 2024
Instructor: Engr. Robin Valenzuela	Semester and SY: 1st Semester 2024 - 2025

Activity 2: SSH Key-Based Authentication and Setting up Git

1. Objectives:

- 1.1 Configure remote and local machine to connect via SSH using a KEY instead of using a password
- 1.2 Create a public key and private key
- 1.3 Verify connectivity
- 1.4 Setup Git Repository using local and remote repositories
- 1.5 Configure and Run ad hoc commands from local machine to remote servers

Part 1: Discussion

It is assumed that you are already done with the last Activity (**Activity 1: Configure Network using Virtual Machines**). *Provide screenshots for each task.*

It is also assumed that you have VMs running that you can SSH but requires a password. Our goal is to remotely login through SSH using a key without using a password. In this activity, we create a public and a private key. The private key resides in the local machine while the public key will be pushed to remote machines. Thus, instead of using a password, the local machine can connect automatically using SSH through an authorized key.

What Is ssh-keygen?

Ssh-keygen is a tool for creating new authentication key pairs for SSH. Such key pairs are used for automating logins, single sign-on, and for authenticating hosts.

SSH Keys and Public Key Authentication

The SSH protocol uses public key cryptography for authenticating hosts and users. The authentication keys, called SSH keys, are created using the keygen program.

SSH introduced public key authentication as a more secure alternative to the older .rhosts authentication. It improved security by avoiding the need to have password stored in files and eliminated the possibility of a compromised server stealing the user's password.

However, SSH keys are authentication credentials just like passwords. Thus, they must be managed somewhat analogously to usernames and passwords. They should have a proper termination process so that keys are removed when no longer needed.

Task 1: Create an SSH Key Pair for User Authentication

1. The simplest way to generate a key pair is to run `ssh-keygen` without arguments. In this case, it will prompt for the file in which to store keys. First, the tool asked where to save the file. SSH keys for user authentication are usually stored in the users `.ssh` directory under the home directory. However, in enterprise environments, the location is often different. The default key file name depends on the algorithm, in this case `id_rsa` when using the default RSA algorithm. It could also be, for example, `id_dsa` or `id_ecdsa`.
2. Issue the command `ssh-keygen -t rsa -b 4096`. The algorithm is selected using the `-t` option and key size using the `-b` option.
3. When asked for a passphrase, just press enter. The passphrase is used for encrypting the key, so that it cannot be used even if someone obtains the private key file. The passphrase should be cryptographically strong.

```
vbbose@bryanbose:~$ ssh-keygen -t rsa -b 4096
Generating public/private rsa key pair.
Enter file in which to save the key (/home/vbbose/.ssh/id_rsa):
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/vbbose/.ssh/id_rsa.
Your public key has been saved in /home/vbbose/.ssh/id_rsa.pub.
The key fingerprint is:
SHA256:kpb5ypafhFcadh/yU9QUxlxrMAEa3GhC+L2tXTJU6D4 vbbose@bryanbose
The key's randomart image is:
+---[RSA 4096]---+
|      0...0.0.00=|
|      . . +00 .==|
|      . +.. .0.0.|
|      = . 0 ..   |
|      * S 0 . .   |
|      . = * E +   |
|      ..= 0 0     |
|      .0+ 0 . .   |
|      .0.0        |
+-----[SHA256]-----+
```

4. Verify that you have created the key by issuing the command `ls -la .ssh`. The command should show the `.ssh` directory containing a pair of keys. For example, `id_rsa.pub` and `id_rsa`.

```
vbbose@bryanbose:~$ ls -la .ssh
total 16
drwx----- 2 vbbose vbbose 4096 Sep 11 07:52 .
drwxr-xr-x 15 vbbose vbbose 4096 Sep 11 07:51 ..
-rw----- 1 vbbose vbbose 3243 Sep 11 07:52 id_rsa
-rw-r--r-- 1 vbbose vbbose 742 Sep 11 07:52 id_rsa.pub
```

Task 2: Copying the Public Key to the remote servers

1. To use public key authentication, the public key must be copied to a server and installed in an *authorized_keys* file. This can be conveniently done using the *ssh-copy-id* tool.
2. Issue the command similar to this: *ssh-copy-id -i ~/.ssh/id_rsa user@host*
3. Once the public key has been configured on the server, the server will allow any connecting user that has the private key to log in. During the login process, the client proves possession of the private key by digitally signing the key exchange.
4. On the local machine, verify that you can SSH with Server 1 and Server 2. What did you notice? **It logs straight to the server.** Did the connection ask for a password? **It didn't ask for a password.** If not, why? **Public key serves as a key for recognizing the workstation to server 1 and 2 as a safe connection. It's like adding a machine to the list that the workstation can control or access through the Public Key Authorization.**

Server 1 Copying Public Key:

```
vbbose@workstation:~$ ssh-copy-id -i ~/.ssh/id_rsa vbbose@server1
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/vbbose/.ssh/id_rsa.pub"
The authenticity of host 'server1 (192.168.56.106)' can't be established.
ECDSA key fingerprint is SHA256:ECE2v8U6JvXZCufiabpzmC+H7kIbbRXTBSPkUNLX8xU.
Are you sure you want to continue connecting (yes/no)? y
Please type 'yes' or 'no': yes
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to install the new keys
vbbose@server1's password:

Number of key(s) added: 1

Now try logging into the machine, with: "ssh 'vbbose@server1'"
and check to make sure that only the key(s) you wanted were added.
```

Server 2 Copying Public Key:

```
vbbose@workstation:~$ ssh-copy-id -i ~/.ssh/id_rsa vbbose@server2
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/vbbose/.ssh/id_rsa.pub"
The authenticity of host 'server2 (192.168.56.107)' can't be established.
ECDSA key fingerprint is SHA256:JY39zvdIq3wpCSv5AUfKMW+78sjpqPqLtNw5aSCRD5I.
Are you sure you want to continue connecting (yes/no)? yes
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to install the new keys
vbbose@server2's password:

Number of key(s) added: 1
Terminal
Now try logging into the machine, with: "ssh 'vbbose@server2'"
and check to make sure that only the key(s) you wanted were added.
```

Testing Workstation to Server 1:

```
vbbose@workstation:~$ ssh vbbose@server1
Welcome to Ubuntu 18.04.6 LTS (GNU/Linux 5.4.0-150-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com
 * Support:       https://ubuntu.com/pro

Expanded Security Maintenance for Infrastructure is not enabled.

0 updates can be applied immediately.

Enable ESM Infra to receive additional future security updates.
See https://ubuntu.com/esm or run: sudo pro status

Failed to connect to https://changelogs.ubuntu.com/meta-release-lts. Check your
Internet connection or proxy settings

Your Hardware Enablement Stack (HWE) is supported until April 2023.
```

Testing Workstation to Server 2:

```
vbbose@workstation:~$ ssh vbbose@server2
Welcome to Ubuntu 18.04.6 LTS (GNU/Linux 5.4.0-150-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:    https://landscape.canonical.com

```

Reflections:

Answer the following:

1. How will you describe the ssh-program? What does it do?
SSH (Secure Shell) is a network protocol that allows you to securely access remote computers. It is intended to protect communications by encrypting all data sent between the client and the server. This protects against illegal access and eavesdropping. What it does is that it gives you access to remote servers through Remote Login. Next it allows you to file transfers remotely through SSH, even Command Execution etc.
2. How do you know that you already installed the public key to the remote servers?
To check, you can verify through the authorization file, check if the public key is in the file. Next is test the SSH connection to verify if you have access.

Part 2: Discussion

Provide screenshots for each task.

It is assumed that you are done with the last activity (**Activity 2: SSH Key-Based Authentication**).

Set up Git

At the heart of GitHub is an open-source version control system (VCS) called Git. Git is responsible for everything GitHub-related that happens locally on your computer. To use Git on the command line, you'll need to download, install, and configure Git on your computer. You can also install GitHub CLI to use GitHub from the command line. If you don't need to work with files locally, GitHub lets you complete many Git-related actions directly in the browser, including:

- Creating a repository
- Forking a repository
- Managing files
- Being social

Task 3: Set up the Git Repository

1. On the local machine, verify the version of your git using the command *which git*. If a directory of git is displayed, then you don't need to install git. Otherwise, to install git, use the following command: *sudo apt install git*

```
vbbose@workstation:~$ sudo apt install git
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following package was automatically installed and is no longer required:
  libllvm7
Use 'sudo apt autoremove' to remove it.
The following additional packages will be installed:
  git-man liberror-perl
Suggested packages:
  git-daemon-run | git-daemon-sysvinit git-doc git-el git-email git-gui gitk
  gitweb git-cvs git-mediawiki git-svn
The following NEW packages will be installed:
  git git-man liberror-perl
0 upgraded, 3 newly installed, 0 to remove and 0 not upgraded.
Need to get 4,817 kB of archives.
After this operation, 34.3 MB of additional disk space will be used.
Do you want to continue? [Y/n] y
```

2. After the installation, issue the command *which git* again. The directory of git is usually installed in this location: *user/bin/git*.

```
vbbose@workstation:~$ which git
/usr/bin/git
vbbose@workstation:~$
```

3. The version of git installed in your device is the latest. Try issuing the command `git --version` to know the version installed.

```
vbb@workstation:~$ git --version
git version 2.34.1
vbb@workstation:~$
```

4. Using the browser in the local machine, go to www.github.com.
5. Sign up in case you don't have an account yet. Otherwise, login to your GitHub account.
 - a. Create a new repository and name it as CPE232_yourname. Check Add a README file and click Create repository.

Create a new repository

A repository contains all project files, including the revision history. Already have a project repository elsewhere?
[Import a repository.](#)

Required fields are marked with an asterisk (*).

Owner *

 GeloaceRT

Repository name *

CPE212_ZAMORA_Angelo

✔ CPE212_ZAMORA_Angelo is available.

Great repository names are short and memorable. Need inspiration? How about [super-duper-goggles](#) ?

Description (optional)

☒  **Public**

Anyone on the Internet can see this repository. You choose who can commit.

☐  **Private**

You choose who can see and commit to this repository.

Initialize this repository with:

☒ Add a README file

- b. Create a new SSH key on GitHub. Go your profile's setting and click SSH and GPG keys. If there is an existing key, make sure to delete it. To create a new SSH keys, click New SSH Key. Write CPE232 key as the title of the key.

Add new SSH Key

Title

CPE212 Key

Key type

Authentication Key

- c. On the local machine's terminal, issue the command `cat .ssh/id_rsa.pub` and copy the public key. Paste it on the GitHub key and press Add SSH key.

Add new SSH Key

HTTPS GitHub CLI

git@github.com:jvtaylor-cpe/CPE302_you

Use a password-protected SSH key.

Download ZIP

CPE302_yourname

- e. Issue the command `git clone` followed by the copied link. For example, `git clone git@github.com:jvtaylor-cpe/CPE232_yourname.git`. When prompted to continue connecting, type yes and press enter.
- f. To verify that you have cloned the GitHub repository, issue the command `ls`. Observe that you have the `CPE232_yourname` in the list of your directories. Use `CD` command to go to that directory and `LS` command to see the file `README.md`.
- g. Use the following commands to personalize your git.
- `git config --global user.name "Your Name"`
 - `git config --global user.email yourname@email.com`
 - Verify that you have personalized the config file using the command `cat ~/.gitconfig`
- h. Edit the `README.md` file using `nano` command. Provide any information on the markdown file pertaining to the repository you created. Make sure to write out or save the file and exit.
- i. Use the `git status` command to display the state of the working directory and the staging area. This command shows which changes have been staged, which haven't, and which files aren't being tracked by Git. Status output does not show any information regarding the committed project history. What is the result of issuing this command?
- j. Use the command `git add README.md` to add the file into the staging area.
- k. Use the `git commit -m "your message"` to create a snapshot of the staged changes along the timeline of the Git projects history. The use of this command is required to select the changes that will be staged for the next commit.
- l. Use the command `git push <remote><branch>` to upload the local repository content to GitHub repository. Pushing means to transfer commits from the local repository to the remote repository. As an example, you may issue `git push origin main`.
- m. On the GitHub repository, verify that the changes have been made to `README.md` by refreshing the page. Describe the `README.md` file.

You can notice the how long was the last commit. It should be some minutes ago and the message you typed on the git commit command should be there. Also, the README.md file should have been edited according to the text you wrote.

Reflections:

Answer the following:

3. What sort of things have we so far done to the remote servers using ansible commands? First we were able to create a public key to give access to the remote servers. Because whenever I establish an SSH Connection to the remote servers there will be no password to be prompted. With SSH, I have the access to work on the remote servers in just a single VM through the public key authorization access of SSH. Lastly, we were able to link a git repository in our very own VM, through the git commands to make it happen. We were able to modify, edit, and commit to the README.md through a terminal which is amazing.
4. How important is the inventory file?
The inventory file is essential in Git repositories that use SSH for authentication. It serves as a centralized area for storing remote server IP addresses or host names. This simplifies the management and maintenance of connections to numerous servers by eliminating the need to explicitly declare their details for each action.

Conclusions/Learnings:

This exercise successfully illustrated how to configure distant and local machines for a secure SSH connection utilizing public-key authentication, which eliminates the need for passwords. The development of a public and private key pair was a critical stage in this procedure, guaranteeing that only authorized users had access to the remote workstations.

Furthermore, successfully establishing a Git repository on both local and remote workstations enabled effective version control and collaboration. The ability to execute ad hoc commands from a local system to remote servers demonstrated SSH's power and flexibility, allowing for remote administration and job execution. Overall, this exercise provided useful insights into how SSH may be used to administer remote systems securely and efficiently.
